

Using the Fork Lift Sleeves

Fork Lift Sleeve Usage

The Fork Lift Sleeve is an accessory attachment that allows you to lift 1 or 2 barriers using a strap. Barriers can be loaded or unloaded from trailers or pallets and placed in the desired deployment location.

Fork Sleeve Attachment

The metal fork sleeve clamp should slide onto one of the forklift prongs and be secured into place using the dials on either side. Position the clamp at least 12 inches from the end of the forklift prong with the hook hanging on the bottom.

IMPORTANT: Be sure to connect the orange safety strap **A** to the fork lift sleeve and a secure spot on the fork lift chassis.

Fold the strap in half and pass one end under the horizontal bar **B** at the rear of the barrier.

Connect the other end of the strap to the hook and ensure that it is securely attached.

Lifting the Barriers

A single barrier may be lifted with one Fork Lift Sleeve or two barriers may be lifted with one sleeve on each fork lift prong.

DO NOT attempt to lift two barriers with a single fork lift sleeve.

The barriers may rotate when elevated. Use a spotter to gently stop any spinning as well as to orient the barrier for proper placement when lowered. Remove the strap when barrier is in the desired location.

Repeat the process for returning barriers to a trailer, pallet or other transportation method.
